

Abstract of the Disclosure

A device for safely storing a firearm such as a rifle or shotgun includes a frame for securing the device to a surface such as a vehicle floorboard or the like. The device is defined by a locking system for closing off the end of a barrel and the clip area as well as for precluding access to the trigger device. A lock housing, slidably positionable on a tubular member secured to the frame, enables accommodation for various length barrels, and is deployed to close off the open end thereof. The device is particularly adapted for safely mounting and storing a pair of firearms.
